

On-Premises

The EDWARD On-Premises solution allows the EDWARD application suite to be hosted within a company's own IT infrastructure. Unlike the SaaS version, this solution allows for greater autonomy in terms of operating conditions and greater control over the company's data.

Advantages of the On-Premises solution

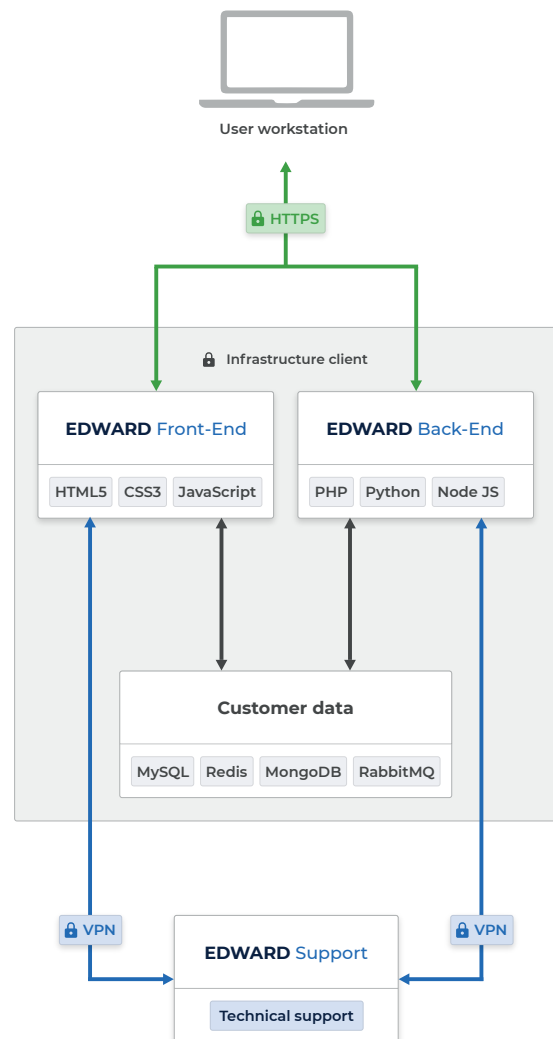

- The installation respects the client company's infrastructure and security policy.
- The data stays inside the company. The application is managed in-house exclusively by the internal IT team.
- Database and file backups are organised and ensured by the internal IT team in line with their requirements.
- User access to the application can be limited to certain e-mail addresses (domain name limitation) and via a VPN connection.

What an On-Premises solution entails

- Involvement of internal IT/IS teams in the life of the project (backup, updates, supervision, technical support for the data).
- Initial investments are higher than those for a SaaS solution (purchase, installation and maintenance of servers, training of internal teams).

Services always provided by the EDWARD team

- Application update (on site or with temporary VPN access).
- Technical support by phone or e-mail from the internal IT team for administrating the application.
